FARM PRODUCTION, DISPOSITION AND INCOME FROM MILK 1943, 1/

- - SUMMARY - -

Milk production on farms in 1943 was the second highest in the Nation's history, about 11 percent below that in 1942. Milk, cream and farm-churned butter sold by farmers represented a total of $97\frac{1}{2}$ billion pounds of milk, about five-sixths of that produced. More whole milk was sold to plants and dealers than in any previous year, but quantities of cream, retail milk and farm butter sold by producers were less than during 1942. Prices received by farmers for all types of dairy products were the highest since 1920, with substantial gains over a year earlier paced by the 26 percent increase in butterfat prices. Returns per 100 pounds of milk utilized in products sold averaged \$2.88 in 1943, an advance of 21 percent over 1942. The cash value of the dairy products sold by farmers totaled 2.8 billion dollars, an all-time high. Milk used for food purposes on farms where produced amounted to over 17 billion pounds and was valued at more than half a billion dollars. Gross farm income from dairy products, including both the cash income and the value of farm-consumed products but without deductions for farmers' expenses, totaled 3.3 billion dollars, about a fifth more than in any previous year.

Milk production lower in 1943

Milk production on farms in the United States in 1943 was estimated at 118.1 billion pounds, a decline of about 1 percent from the 1942 record high production of 119.2 billion pounds. Milk cow numbers increased throughout the year, continuing the steady upward trend that began in early 1938. The average number of milk cows on farms during 1943 was 25.7 million head, about 2 percent more than in 1942. On the other hand milk production per cow dropped materially under 1942 levels as the result of a less favorable pasture season, local scarcities and rising costs of feed and a smaller percentage of the milk cows kept in production under the heavy work load handled by a limited farm labor force. Wisconsin with a production of 14.3 billion pounds of milk again led all States. Other ranking States in order were Minnesota 8.9 billion pounds, New York 7.8 billion, Iowa 7.1 billion, Illinois 5.4 billion, Michigan 5.3 billion, and California with 5.2 billion. In 30 out of the 48 states milk production in 1943 was lower than in 1942, with heaviest decreases centered in the Atlantic Coast area from Maryland northward and in the eastern Corn Belt.

Production of farm-churned butter in 1943, estimated at 340 million pounds, was 7 percent less than in 1942. Increasing alternative outlets for milk in Southern States where most of the farm butter is churned, together with a rising spread of butterfat prices over butter prices, have contributed toward maintaining the downward trend of home churning that has persisted with only minor interruptions since the turn of the century. Production estimates for individual states in 1943 are shown in table 14.

1/ The section of this publication dealing with farm production and income from milk was prepared by John L. Wilson, Senior Agricultural Statistician. The material on market statistics of manufactured products beginning on page 22 was prepared by Mr. C. J. Heltemes, Agricultural Statistician. The work was directed by B. H. Bennett, Principal Agricultural Statistician in charge, Dairy Section, Division of Agricultural Statistics.

1/ Approximations based chiefly on population in small towns and rural areas where most families purchase their milk from local farmers.

2/ Revised.

3/ Preliminary.

Farm sales of milk up, cream down

Some 97½ billion pounds, or five-sixths of the milk produced on farms was sold or used in the preparation of products for sale. Deliveries of whole milk to plants and dealers, totaling over 60 billion pounds, was the most important single item sold. These bulk sales of milk by farmers supply milk distributors who re-sell milk and cream to consumers in fluid form and also the dairy manufacturing plants which convert whole milk to manufactured products such as cheese, evaporated milk, etc. The increase in whole milk deliveries in 1943 was the smallest annual change in a decade of steady expansion. Declines in milk production were sharpest in areas where farmers normally deliver whole milk so that moderate shifts from sale of cream to sale of milk in other areas brought only a small national increase in whole milk deliveries despite keen demand for fluid milk and manufactured products from whole milk. Milk skimmed on farms for sale as cream in 1943, estimated at 30.7 billion pounds, was down about 1 billion pounds from 1942. Other milk utilized for products sold included 5.6 billion pounds for retail delivery by farmers direct to consumers and about a billion pounds for making farm butter for sale.

The use of milk on farms where produced declined in 1943 largely as a result of reduced production of milk, declining farm population, and the trend away from making butter on the farm. Milk for consumption as milk or cream in farm households accounted for 11.6 billion pounds of milk, a decline of about 2 percent from 1942. Butter consumed on farms where churned required the fat from 5.8 billion pounds of milk, about 6 percent less than in the previous year. In addition to the milk used for food on farms, some 3.3 billion pounds of whole milk was fed to calves. All farm uses of milk totaled 20.7 billion pounds of milk in 1943, the smallest annual volume in 20 years of record. State estimates of amounts of milk used for each purpose in 1943 are shown in table 15.

TABLE -- FARM DAIRY PRODUCTS: QUANTITIES SOLD, PRICE AND VALUE; VALUE OF PRODUCTS CONSUMED IN THE FARM HOUSEHOLD; AND GROSS FARM INCOME FROM DAIRY PRODUCTS, UNITED STATES, 1924-43

1/ Computed from the value of milk, cream, and farm butter sold, divided by the quantity of milk or butterfat used in the preparation of these products for market.

2/ Milk and milk equivalent of cream and farm butter consumed, valued at the average returns for milk utilized in dairy products sold.

3/ Value of combined sales plus value of products consumed in the farm household.

4/ Revised.

5/ Preliminary

Income from milk at all-time high

Cash farm income from dairy products mounted to new high records in 1943 under the influence of a close-to-record volume of sales and the highest prices in more than a score of years. The value of milk, cream and farm-churned butter sold by United States farmers totaled \$2,804,078,000, an increase of nearly one-half billion dollars over 1942, and almost three times the annual cash income from milk at the bottom of the depression less than a dozen years ago. Income from dairy products accounted for about one-fourth of the 1943 cash income from livestock and livestock products and about 15 percent of the total cash income from farm marketings of crop and livestock items exclusive of Government payments.

The 1943 value of milk products consumed by people living on farms where the milk was produced is estimated at 534 million dollars, an increase of 17 percent over 1942 and a 20-year high despite the small volume of milk represented. Gross farm income from dairy products, combining cash income with the value of consumption on farms but without deductions for expenses of production which rose sharply in 1943, totaled \$3,338,276,000. These figures do not include some 50 million dollars paid direct to farmers as dairy production incentive payments, nor some 575 million dollars accruing to farmers from the sale for beef of cows discarded from their milking herds and calves dropped by milk cows.

Whole milk sales most important

Of the several forms of milk products sold from farms, whole milk delivered to plants and dealers was the leading income producer. Payments to farmers for 60 billion pounds of milk sold at \$3.12 per hundredweight amounted to \$1,874,224,000, about two-thirds of farmers' cash returns from dairy products. As compared with 1942, the income from wholesale milk was up 23 percent mainly as the result of the sharp price increase. Butterfat in cream sold to plants and dealers, principally for making butter, returned producers 572 million dollars in 1943. The quantity of butterfat sold, estimated at 1,147 million pounds, was less than in 1942, but prices to farmers averaged 49.9 cents per pound, an increase of more than 10 cents. Most of the rise in price came in late 1942 but its effect on farm income showed up mainly in 1943. Cash returns from milk retailed by farmers, at 334 million dollars, was the highest in a dozen years despite a steady decline in volume of sales. From the sale of farm-churned butter, producers received 23 million dollars, somewhat more than in any of the preceding 5 years but only about a third as much as received by farmers for this product 20 years ago.

In cash farm income from milk, cream and farm-churned butter combined, Wisconsin, with 347 million dollars, led all States. New York was next with 243 million dollars; then came Minnesota with 173 million dollars, California with almost 170 million dollars, and Pennsylvania with 159 million dollars. Leading States in farm income derived from whole milk sold to plants and dealers were Wisconsin, New York, California, and Pennsylvania. Largest income from sale of cream by farmers centered in the important butter producing States of the West North Central States. Minnesota with value of sales totaling 108 million dollars led, followed by Iowa, Nebraska, and Kansas. Returns to producers for milk retailed directly to consumers was highest in Pennsylvania, followed by California. Income from sale of farm-churned butter was greatest in the Southern States with Texas well in the lead. For State details on income from dairy products see table 16.

With prices of all dairy products up sharply in 1943, returns to farmers for milk used in products sold in 1943 averaged \$2.88 per 100 pounds, substantially above any other year in two decades. As usual the average returns per hundredweight of milk varied widely between States, depending on the type of milk product sold from farms and on regional variations in prices of individual products. Average returns were highest in deficit producing States along the eastern seaboard where milk for fluid uses commands a relatively high price and where a fairly large proportion was retailed by farmers direct to consumers. In seven States, including Florida, South Carolina, Massachusetts, Connecticut, Rhode Island, New Jersey, and Maryland, the returns per 100 pounds of milk in products sold exceeded \$4.00. On the other hand milk producers in the Dakotas and Nebraska received an average return of less than \$2.00 per hundred pounds since most of the milk was skimmed and sold as sour cream.

Dairy products consumed in the household on farms where produced, valued in each State on a milk equivalent basis at the average returns per hundredweight for milk used in dairy products sold, were worth 534 million dollars in 1943. About three-fifths of the National total was in Southern States which produce only one-fifth of the Nation's total milk. The value of home-consumption exceeded cash income in five States - North Carolina, South Carolina, Georgia, Alabama and Mississippi, where milking herds average only about 2 cows per farm. However, Texas with a large farm population and a large production of farm butter was the leading State in value of dairy products consumed in farm households.

3/ Milk and milk equivalent of cream and farm butter consumed, valued at the average returns for milk utilized in dairy products sold.

4/ Value of combined sales, plus value of products consumed in the farm household.

In line with a smaller production of milk on farms and the use of more milk for fluid purposes, the output of the major manufactured dairy products declined in 1943 compared with the previous year. Production of creamery butter was down between 4 and 5 percent. American Cheddar Cheese about 16 percent and evaporated milk 13 percent. Partially offsetting these declines, the output of dried whole milk in 1943 was more than double that of a year earlier, while production of sweetened condensed milk, case goods (skimmed and unskimmed combined) increased 64 percent. The combined use of whole milk for manufactured dairy products, however, was only 55.8 billion pounds in 1943, or 8 percent less than the all-time high of 1942.

The output of creamery butter during 1943 is placed at 1,685,825,000 pounds compared with 1,764,054,000 pounds in 1942 and the 5-year (1937-41) average of 1,780,178,000 pounds. During each of the first 4 months of 1943, butter production exceeded the output of the comparable month a year earlier, with increases ranging from 1 to 4 percent. However, since total milk production was slow in reaching the seasonal peak, butter production was down 5 percent in May. With milk production holding up unusually well in late June, the June butter output slightly exceeded that of June 1942. In July, milk production dropped back to the same level as in 1942 while butter production was between 3 and 4 percent lower. Owing to continued lower milk production and competition from other outlets for milk, butter output in each of the last 5 months of 1943 was sharply lower than in the comparable months a year earlier, with the declines ranging from about 9 percent in September to more than 16 percent in December.

American Cheddar cheese production in 1943 is estimated at 771,410,000 pounds as against 916,850,000 pounds in 1942 and the 5-year average of 589,159,000 pounds. Output was lower than a year earlier in all months of 1943 with the exception of December. This consistent decline was due partly to increased production of other types of whole milk cheeses not under the set-aside provisions of the War Food Administration. The output of all cheese, except cottage and other skim-milk cheese, showed a smaller percent decline for the year than was shown by American Cheddar alone, and output was larger the last four months of 1943 than in the comparable months a year earlier.

The output of evaporated milk, case goods, declined to 3,075,048,000 pounds in 1943 from 3,518,504,000 pounds in 1942, but the production of sweetened condensed, case goods, increased, totaling 110,128,000 pounds as against 67,292,000 pounds in 1942. Evaporated milk-case goods production was sharply lower than a year earlier during the first six months and moderately lower during the last three months of 1943. From July through September, production was moderately higher than a year earlier. Output of sweetened condensed, case goods, was larger every month of 1943 than in 1942.

With the demand for manufactured dairy products and fluid milk increasing, prices rose to higher levels. Condenseries paid an average of \$2.61 per hundredweight for milk testing 3.5 percent butterfat, F.O.B. the factory, the highest in more than 20 years of record, and about 25 percent more than the 1942 average of \$2.08. Prices paid by condenseries increased a few cents per hundredweight nearly every month during 1943, starting with \$2.53 in January and rising to \$2.72 in December. Milk dealers, buying prices of milk for city distribution also were at the highest level in more than 20 years, averaging \$3.16 per hundredweight for 3.5 percent milk F.O.B. local shipping points or country plants, and as in the case of milk sold to condenseries, the price increased nearly every month. Prices of fluid milk and of milk sold to condenseries were higher in January and February 1944 than in December 1943.

Manufacturers' wholesale selling prices increased somewhat in line with the increase in the price for raw milk. Evaporated milk averaged \$4.15 per case of 48-14-1/2 oz. cans, up 53 cents, or 15 percent, from the 1942 average of \$3.62. Sweetened condensed milk averaged \$5.84 per case of 48-14-oz. cans, an increase of only 12 cents from the 1942 average of \$5.72. After a sharp rise in late 1942, the price of both evaporated and sweetened condensed case goods remained constant nearly every month in 1943 and it also remained at the same level during the first two months of 1944. The price of dried whole milk averaged 32.76 cents per pound, up 6.76 cents from the 1942 average of 26.00 cents and the highest in 20 years on record. The price of dried skim milk for human consumption remained fairly steady during 1943 but it was nearly a cent per pound higher than in 1942, averaging 13.81 cents as against 12.94 cents the previous year, but dried skim milk prices took a sharp jump in 1942. Dried skim milk for animal feed averaged 8.74 cents per pound or 8 percent above the 1942 average of 8.10 cents.

The retail price of fluid milk, for that quality of milk most commonly sold in 25 cities, delivered to homes, averaged 14.81 cents per quart. While this represents an increase of only 4 percent compared with the 1942 average of 14.24 cents and 14 percent compared with 1941, it is the highest since 1920 when the average was 15.9 cents per quart.

Manufacturers' stocks of evaporated canned milk on January 1, 1944 were more than double the unusually low supply on hand on that date a year earlier, but they were 16 percent under the 5-year (1938-42) January 1 average. During the first two months of 1944 stocks declined seasonally but continued at a substantially higher level than in the early months of 1943. In line with increased production, January 1, 1944 stocks of canned sweetened condensed milk were 52 percent over the low supply on that date in 1943, but somewhat under the 5-year average. By March 1, 1944, the supply on hand was above the average and at about the same level as in 1943 at that date.

January 1, 1944 stocks of dried skim milk for human consumption, held by manufacturers, were 18 percent less than on January 1 a year earlier, but 6 percent above the 5-year January 1 average. The larger share of these stocks, however, were being held for delivery on government set-aside requirements. The supply of dried skim milk for animal feed on January 1, 1944 was unusually low -- 75 percent less than a year earlier and 92 percent under the January 1 average. On the other hand, manufacturers' stocks of dried whole milk on hand at the beginning of 1944 were 6 percent larger than a year earlier and 83 percent over the January 1 average.
